

# Part 2: Graphing Sine and Cosine

To graph sine and cosine, we will be using a Cartesian plane that has angles for x values.

**Example 1:** Complete the following table of values for the function  $f(x) = \sin(x)$ . Use special triangles, the unit circle, or a calculator to find values for the function at  $30^\circ = \frac{\pi}{6}$  radian intervals.

**Example 2:** Complete the following table of values for the function  $f(x) = \cos(x)$ . Use special triangles, the unit circle, or a calculator to find values for the function at  $30^\circ = \frac{\pi}{6}$  radian intervals.

## **Properties of both Sine and Cosine Functions**

Domain:

Range:

Period:

Amplitude:

\_\_\_\_\_: the horizontal length of one cycle on a graph.

\_\_\_\_\_: half the distance between the maximum and minimum values of a periodic function.

# Part 3: Graphing the Tangent Function

**Recall:**  $\tan \theta = \frac{\sin \theta}{\cos \theta}$ 

**Note:** Since  $\cos \theta$  is in the denominator, any time  $\cos \theta = 0$ ,  $\tan \theta$  will be undefined which will lead to a vertical asymptote.

Since  $\sin \theta$  is in the numerator, any time  $\sin \theta = 0$ ,  $\tan \theta$  will equal 0 which will be an *x*-intercept.

**Example 3:** Complete the following table of values for the function  $f(x) = \tan(x)$ . Use the quotient identity to find *y*-values.

| x                                  | tan x |     |        |       |       |       |       |      |     |        |      |      |      |      |     |   |     |    |     |      |      |   |      |      |     |       |      |       |    |

#### Part 4: Graphing Reciprocal Trig Functions

| Reci           | procal Identities |                |
|----------------|-------------------|----------------|
| $csc \theta =$ | sec $\theta =$    | $cot \theta =$ |

The graph of a reciprocal trig function is related to the graph of its corresponding primary trig function in the following ways:

- Reciprocal has a vertical asymptote at each zero of its primary trig function
- Has the same positive/negative intervals but intervals of increasing/decreasing are reversed
- y-values of 1 and -1 do not change and therefore this is where the reciprocal and primary intersect
- Local min points of the primary become local max of the reciprocal and vice versa.

**Example 4:** Complete the following table of values for the function  $f(x) = \csc(x)$ . Use the reciprocal identity to find *y*-values.

## **Properties of the Cosecant Function**

Domain:

Range:

Period:

**Example 5:** Complete the following table of values for the function  $f(x) = \sec(x)$ . Use the reciprocal identity to find *y*-values.

## **Properties of the Secant Function**

Domain:

Range:

Period:

**Example 6:** Complete the following table of values for the function  $f(x) = \cot(x)$ . Use the reciprocal identity to find *y*-values.
