Part 1: Try and Solve a Logarithmic Equation

Solve the equation $\log(x + 5) = 2 \log(x - 1)$

Hint: apply the power law of logarithms to the right side of the equation

---

Note:

If $\log_m a = \log_m b$, then $a = b$.

To complete this lesson, you will need to remember how to change from logarithmic to exponential:

$$y = \log_b x \rightarrow$$

Part 1: Solve Simple Logarithmic Equations

Example 2: Solve each of the following equations

a) $\log(x + 4) = 1$

> **Method 1:** re-write in exponential form

> **Method 2:** express both sides as a logarithm of the same base

b) $\log_5(2x - 3) = 2$

Part 2: Apply Factoring Strategies to Solve Equations

Example 3: Solve each equation and reject any extraneous roots

a) $\log(x - 1) - 1 = -\log(x + 2)$

b) $\log \sqrt[3]{x^2 + 48x} = \frac{2}{3}$

c) $\log_3 x - \log_3(x - 4) = 2$

Example 4: If $\log_a b = 3$, then use log rules to find the value of…

a) $\log_a ab^2$

b) $\log_b a$

Hint: need to change the base

$$\log_b m =$$
